About

The demo form has been constructed using the built in `pretty_html` feature which aids in the construction of html using a built in class that automatically handles the opening and closing of html elements. It can be compiled using the makefile in this folder. When run it will automatically generate this page in html and the pdf of the same name in this folder.

Margins

Page margins are defined in the bundled templates. While the defaults follow standard technical documentation guidelines, business forms often require narrower margins to maximize layout real estate. You can modify the templates directly, but we recommend creating a custom copy to preserve the original defaults.

Avoid Double Scaling

The most common cause of incorrect margin sizes is printer-side scaling. Because these templates already define precise hardware margins, applying 'Fit to Page' or 'Shrink to Fit' in your PDF viewer will compound the margins, resulting in an undersized layout. For 1:1 parity, always print at 'Actual Size' (100%).

Style Sheets

This example embeds the stylesheet directly. While not required, this ensures the HTML remains completely portable and self-contained, preventing layout breakage if external CSS assets are moved or unreachable.

Images

To ensure document integrity and total portability, the logo in this example is Base64 encoded and embedded directly. This eliminates external dependencies and prevents 'broken image' placeholders in air-gapped or archived environments.

Pages

New pages are created by utilising the **page** and **subpage** classes.

```
<div class="page">
  <div class="subpage">
    page content....
  </div>
</div>
```
